Module 9) React
Lists , Hooks , Localstorage , Api Project
Lists and Keys

• Question 1: How do you render a list of items in React? Why is it important to use keys when rendering lists?

Answer: You can render a list using `.map()` in React.
Keys help React identify which items changed, added, or removed.

• Question 2: What are keys in React, and what happens if you do not provide a unique key?

Answer: Keys are unique identifiers for each list item.
If keys are not unique, React may not update the list correctly.
